## In the Claims:

1. (Currently Amended) A method of dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising the steps of:

identifying a parameter associated with a data packet transported across the network; measuring the parameter after the data packet is transported across the network; and enabling bandwidth optimization of the network bandwidth when said measured parameter differs from a predetermined value, wherein enabling bandwidth optimization includes at least a one of reconfiguring a switching matrix within the network and reducing a number of channels in the network.

2. (Currently Amended) <u>An apparatus</u> Apparatus for dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising:

first and second PBX cabinets interconnected in a local area network configuration for sending and receiving data packets;

a register in connection with at least one of said cabinets for storing a value associated with one or more packets transported across the network;

a comparator for comparing said stored value with a predetermined value; and an optimization mechanism for adjusting the bandwidth of the network when said stored value differs from a predetermined value, and wherein adjusting the bandwidth includes at least a one of reconfiguring a switching matrix within the PBX network and reducing a number of channels in the PBX network.

- 3. (Currently Amended) A method of dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising as set forth in claim 1, wherein[[:]] said parameter comprises a sequence number associated with the payload portion of said data packet.
- 4. (Currently Amended) A method of dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising as set forth in claim 1, wherein[[:]] said parameter comprises measurement of the difference in arrival times of packets sent across the network and back between a first packet and a second packet.

- 5. (Currently Amended) A method of dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising as set forth in claim 1, wherein[[:]] said parameter comprises measurement of the difference in arrival times of packets sent across the network and back between the average value of arrival times of a group of packets and a second packet.
- 6. (Currently Amended) A method of dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising as set forth in Claim claim 3, further comprising the substep of: storing the sequence number of data packets in a register.
- 7. (Currently Amended) A method of dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising as set forth in claim 6, further comprising the substep of: storing sequence numbers associated with successive data packets in the register.
- 8. (Currently Amended) A method of dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising as set forth in claim 7, further comprising the substep of: monitoring the sequence of sequence numbers associated with successive data packets stored.
- 9. (Currently Amended) A method of dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising as set forth in claim 8, further comprising the substep of:

incrementing a counter in the register by a count of one when the sequence numbers of successive data packets stored are in sequential order; and

incrementing the counter by a count greater than one when the sequence numbers of successive data packets stored are out of sequential order.

10. (Currently Amended) A method of dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising as set forth in claim 9, further comprising the

substep of: initiating bandwidth optimization when said counter count is incremented by a count greater than one.

- 11. (Currently Amended) A method of dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising as set forth in claim 10, wherein[[:]] said bandwidth optimization comprises static optimization.
- 12. (Currently Amended) A method of dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising as set forth in claim 11, wherein[[:]] said static optimization comprises limiting the number of channels available on the network.
- 13. (Currently Amended) A method of dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising as set forth in claim 10, wherein[[:]] said bandwidth optimization comprises adaptive optimization.
- 14. (Currently Amended) A method of dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising as set forth in claim 13, wherein[[:]] said adaptive optimization comprises the step of determining which channels are physically represented by cards connected to a PBX network cabinet.
- 15. (Currently Amended) A method of dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising as set forth in claim 13, wherein[[:]] said adaptive optimization comprises the step of determining whether a channel is inactive and remapping an active channel to an available inactive one.

16-19. (Canceled).

20. (Currently Amended) <u>An apparatus Apparatus</u> for dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising:

a parameter identifying mechanism for identifying a parameter associated with a data packet transported across the network;

a parameter measuring device for measuring the parameter after the data packet is transported across the network; and

an optimization enabling device for optimizing the bandwidth of the network when said measured parameter differs from a predetermined value, and wherein optimizing the bandwidth includes at least one of reconfiguring a switching matrix within the network and reducing a number of channels in the network.

- 21. (Currently Amended) An apparatus Apparatus for dynamically adapting a PBX network to maintain a Quality of Service level in the network as set forth in claim 20, wherein[[:]] said parameter comprises a sequence number associated with the payload portion of said data packet.
- 22. (Currently Amended) An apparatus Apparatus for dynamically adapting a PBX network to maintain a Quality of Service level in the network as set forth in claim 20, wherein[[:]] said parameter is derived from measurement of the difference in arrival times of packets set across the network and back between a first packet and a second packet.
- 23. (Currently Amended) An apparatus Apparatus for dynamically adapting a PBX network to maintain Quality of Service level in the network as set forth in claim 20, wherein[[:]] said parameter is derived from measurement of the difference in arrival times of packets sent across the network and back between the average value of arrival times of a group of packets and a second packet.
- 24. (Currently Amended) An apparatus Apparatus for dynamically adapting a PBX network to maintain a Quality of Service level in a network as set forth in claim 21, wherein[[:]] sequence numbers of the data packets are stored together in a register.

- 25. (Currently Amended) <u>An apparatus Apparatus</u> for dynamically adapting a PBX network to maintain a Quality of Service level in a network as set forth in claim 24 wherein[[:]] sequence numbers associated with successive data packets are stored in the register.
- 26. (Currently Amended) An apparatus Apparatus for dynamically adapting a PBX network to maintain a Quality of Service level in the network as set forth in claim 25 wherein[[:]] the sequence of sequence numbers associated with stored successive data packets is monitored.
- 27. (Currently Amended) An apparatus Apparatus for dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising as set forth in claim 26 wherein:

a counter in the register is incremented by a count of one when the sequence numbers of successive data packets stored are in sequential order; and

the counter is incremented by a count greater than one when the sequence numbers of successive data packets are stored are out of sequential order.

- 28. (Currently Amended) An apparatus Apparatus for dynamically adapting a PBX network to maintain a Quality of Service level in the network as set forth in claim 27, wherein[[:]] bandwidth optimization is initiated when the counter count is incremented by a count greater than one.
- 29. (Currently Amended) <u>An apparatus Apparatus</u> for dynamically adapting a PBX network to maintain a Quality of Service level in the network as set forth in claim 28, wherein[[:]] bandwidth optimization comprises static optimization.
- 30. (Currently Amended) An apparatus Apparatus for dynamically adapting a PBX network to maintain a Quality of Service level in the network as set forth in claim 29, wherein[[:]] static optimization comprises limiting the number of channels available on the network.
- 31. (Currently Amended) An apparatus Apparatus for dynamically adapting a PBX network to maintain a Quality of Service level in the network as set forth in Claim 28, wherein:

bandwidth optimization comprises adaptive optimization.

- 32. (Currently Amended) An apparatus Apparatus for dynamically adapting a PBX network to maintain a Quality of Service level in the network as set forth in claim 29, further comprising: adaptive optimization apparatus which determines which channels are physically represented by cards connected to a PBX network cabinet.
- 33. (Currently Amended) An apparatus Apparatus for dynamically adapting a PBX network to maintain a Quality of Service level in the network comprising as set forth in claim 29, wherein[[:]] adaptive optimization determines whether a channel is inactive and re-maps an active channel to an available inactive one.
- 34. (Currently Amended) An apparatus Apparatus for dynamically adapting a PBX network to maintain Quality of Service level in the network comprising as set forth in claim 2, wherein[[:]] said value comprises measurement of the difference in arrival times of packets sent across the network and back between a first packet and a second packet.
- 35. (Canceled).
